AUTHOR: Podil'chuk, Yu. M. (Podil'chuk, Yu. N.) (Kiev)

TITLE: Stress distribution around an elastic ellipsoidal inclusion

SOURCE: Prykladna mekhanika, v. 10, no. 5, 1964, 527-532

TOPIC TAGS: stress concentration, elliptical inclusion, elastic inclusion, elliptical cavity, rigid inclusion, infinite elastic medium, elastic medium inclusion

ABSTRACT: The stress distribution is investigated in an infinite elastic solid around an elastic inclusion in the shape of a triaxial ellipsoid. The principal directions of the homogeneous stress field in the solid at infinity are parallel to the axes of the inclusion and comprise normal and tangential stresses. The solution is obtained by superposition of two stress fields in the solid at infinity: 1) when there are only normal stresses, and 2) when there are only tangential stresses. Case (1) has been analyzed by K. Robinson (Journal of Applied Physics, v. 22,

Card 2/2

L 17835-65

ACCESSION NR: AP4046153

no. 8, 1951), so that only case (2) is investigated by the author. And this state of stress also is treated as the sum of two states of stress: a) a homogeneous state caused by tangential stresses at infinity, and b) an additional state caused by the presence of the inclusion. The tangential-stress concentrations are numerically evaluated for a given triaxial ellipsoid at the extremities of its axes as a multiple of the given tangential stresses at infinity, in the cases of a perfectly rigid and of a perfectly soft inclusion (a cavity). Orig. art. has: 1 figure and 28 formulas.

TITLE: State of stress around an ellipsoidal cavity due to arbitrary constant stresses in infinity β

SOURCE: AN UkrRSR. Dopovidi, no. 9, 1964, 1150-1154

TOPIC TAGS: infinite elastic medium, elastic medium cavity, elastic medium inclusion, stress distribution, elastic medium stress distribution

ABSTRACT: The stress distribution around a triaxial-ellipsoid cavity in an infinite elastic medium is analyzed. It is assumed that at infinity there is a homogeneous state of stress comprising the normal stresses δ and the tangential stresses τ and that on the surface of the cavity there are no external forces. The stress distribution in the medium is determined for the given boundary conditions, and the solution is obtained as the sum of two stress distributions: 1) when $\delta \neq 0, \tau = 0$; and 2) when $\delta = 0, \tau \neq 0$. Case (1) has been investigated

by I. M. Sadowsky and E. Sternberg (J. Appl. Mech. v. 16, 1949, 149) and by A. I. Lur'ya (DAN SSSR, v, 87, 1952, 709). The stress distribution in case (2) is determined in this article by the superposition of a homogeneous state of stress caused by the stresses in infinity and of an additional one due to the presence of the cavity. Orig. art. has: 13 formulas.

TITLE: Absorption spectra in the region of the vacuum ultraviolet of LiF crystals exposed to reactor and γ radiation

SOURCE: AN LatSSR. Izvestiya. Seriya fizicheskikh i tekhnicheskikh nauk, no. 5, 1966, 124-126

TOPIC TAGS: lithium fluoride, uv spectrum, absorption spectrum, gamma irradiation, reactor neutron flux, color center, radiation effect

ABSTRACT: The authors report a study of the rate of formation of additional optical absorption in the region of vacuum ultraviolet (from 11 ev to 5 ev) when LiF crystals of different purity are irradiated in a reactor or exposed to γ rays. The crystals were grown either in vacuum by the Stockbarg method or in air by the Kirooulos method. The reactor dose rates were 8—10 Mrad. The optical absorption was measured with a VMR-2 vacuum monochromator. The absorption spectra disclosed the presence of a β -band (~11 ev), F-band (5 ev), and broad non-elementary bands with weak maxima which were different for the two types of crystal. The results show that the reactor and γ radiation do not differ in their effects. The color centers are produced more effectively in LiF crystals grown in air, and the ratio of the increment of the absorption coefficients in the region 6—9 ev to the increment of the absorption coef-

Card 1/2

ACC NR: AP7001331

ficient of the F-band is larger in the vacuum crystals than in the air crystals. Thus the influence of the impurities on the rate of color-center production is greatly different for the different centers. The author thanks K. K. Shvarts for suggesting the topic and guidance of the work. Orig. art. has: 1 figure.

TITLE: Radiation effects in pile-irradiated LiF crystals

SOURCE: Physica status solidi, v. 18, no. 2, 1966, 897-909

TOPIC TAGS: ^{Inorganic} crystal, lithium fluoride, irradiation, neutron irradiation, electron paramagnetic resonance, ~~optical~~ ^{light} absorption, electron density, ^{activation} effect, irradiated crystal

ABSTRACT: A study was made of electron paramagnetic resonance, optical absorption (in the 2-6 ev range), and density variation in lithium fluoride crystals irradiated in a reactor in amounts up to 10¹⁹ neutrons/cm². The principal paramagnetic defects in the irradiated crystals were found to be F-centers. Conclusions are drawn on the process of radiational expansion in crystals and the formation of color centers. Some aspects of F-center aggregation in the thermal annealing of irradiated crystals are clarified. [Authors' abstract] [DW] - [SP] [W095]

AUTHORS: Podishevnikov, B.F., and Tartakovskiy, B.D.

TITLE: The absorption of sound of finite amplitude in a coagulating aerosol

PERIODICAL: Zhurnal prikladnoy khimii, v. 34, no. 11, 1961, 2573 - 2574

TEXT: When studying the absorption of non-linear sound in a dioctyl phthalate aerosol, obtained by B.F. Podoshevnikov's condensation process (Ref. 2: Dissert. kand., M., 1959), the authors made use of the same apparatus employed in their previous research on the phenomenon of supplementary sound absorption (Ref. 1: Akusticheskiy zh., IV, 4, 369, 1958). Its main features consist of a cylindrical coagulation tower (125 x 12.5 cm) and an electrodynamic resonance emitter of sinusoidal vibrations - to obviate the aerosol's rarefaction by air currents. The tests were conducted under varying conditions for the propagation of sound vibrations in the tower - particularly as regards the coefficient of the spatial ab-

sorption of sound - in a sound field with a frequency of 13 c/s and intensity of 0.02 - 0.2 w/cm². The fact that the intensity of the emitted sound is not unduly influenced by aerosol particles suspended in the air was first experimentally verified. The mean coefficient of absorption was assumed to be governed by the absorption of sound of finite intensity in pure gas and by the supplementary absorption of sound (α_a) due to the presence of uncoagulated aerosol in the tower. The magnitude of α_a was evaluated by directly comparing at different emission intensities the values of the mean sound pressure, measured at 7 points situated 10 mm apart in the middle of the tower, in accordance with the expression

$$\alpha_a = 20 \log \left(\frac{p_g}{p_a} \right) \cdot \frac{1}{h},$$

where p_g and p_a are the sound pressures in pure gas and in the aerosol at a mean distance h from the emitter to their point of measurement. There appear to be little relationship between: (1) α_a and the aerosol concentration in the studied range 1.2 - 3.4 g/

m^3 , and (2) α_a and the sound intensity. The mean value of α_a is 2.7 db/m. The authors conclude that the absorption of sound in an aerosol is of vital significance, and that it must accordingly be taken into account when calculating the intensity of the sound field in accoustic coagulation towers. There are 1 figure and 2 Soviet-bloc references.

Podisko, U.S.

The examination of properties of crystals of potassium dichromate, V. S. Podisko, Trudy Inst. Krist. Akad. Nauk S.S.S.R. 9, 327-33 (1954).--In the past some authors thought these crystals belonged to the pinacoidal class, others to the monohedral class. The present work proves that $K_2Cr_2O_7$ belongs to the monohedral class. There were used: (1) the method of crystn. with priming by means of little balls, (2) crystn. in a standing crystallizer, (3) statistics of faces of crystals, and (4) etching figures. The Pasteur rule says that absence of a 2nd enantiomorphous form (as in the case of $K_2Cr_2O_7$) can only be a result of the action of living organisms, and so if there is one enantiomorphous form, then there must be a 2nd form and also a center of symmetry. Nevertheless it is assumed that only one modification could be present, because Pasteur worked with mol. crystals, but $K_2Cr_2O_7$ are ionic crystals [as are also KCl , NH_4Cl , $Pb(NO_3)_2$, and $Ba(NO_3)_2$], and the presence of only one modification is the result of asymmetry. The $K_2Cr_2O_7$ crystals do not have pyro- and piezoelec. properties. That does not mean that the crystals must have a center of symmetry.

Komenského, Bratislava - BRATISLAVSKÉ LEKÁRSKÉ LISTY 1957, 37/6 (350-354)
Description of a case of 'tick paralysis' caused by a neurotoxin present in the suction apparatus of the tick itself and not by the virus of tick-borne encephalitis. A 54-year-old man developed circular hypaesthesia in segments T 8 and T 9 as early as 3 hr. after being bitten by ticks. Ten days later he presented the picture of tick encephalitis with typical CSF changes. Toxic damage to sensory nerves occurred instead of paralysis in this case.

2244. SPASTIC TORTICOLLIS FROM THE VIEWPOINT OF EMG ANALYSIS OF INVOLUNTARY MOTOR ACTIVITY - Torticollis spasticus z bi'adiska elektromyografickej analyzy mimovol'nej pohybovej činnosti - Podivín-ský F. Odd. Klin. Elektrofyziol. Úst. Exp. Med., Slovenskej Akad. Vied, Bratislava; Neurol. Klin. Lek. Fak., Univ. Komenského, Bratislava - BRATISL. LEK LISTY 1959, 39(1)/7 (408-419) Graphs 11 Illus. 1

Seven cases of spastic torticollis were analysed by EMG. In 3 patients where a psychogenic origin was supposed, the extrapyramidal character of the disease was revealed. In 2 cases considered to be vertebrogenic, the EMG pointed to intermittent hyperkinesia of extrapyramidal origin. In another patient, the origin of torticollis, as shown by EMG, was functional damage of the cervical muscles. Only in one case was the extrapyramidal character of hyperkinesis clear before the EMG study. The author describes and analyses the various patterns of pathologic electrical activity in torticollis and emphasizes the value of EMG for the diagnosis and choice of treatment.

PHASE I BOOK EXPLOITATION
International Polarographic Congress. CZECH/2433

Sborník I. Mezinárodního polarografického sjezdu. 1st, Prague, 1951
Referáty přednesené na sjezdu. Díl 3. Hlavní
čtenáři. Průběh sjezdu. Průběh sjezdu. Vol 3. Reviews
774 p. 2,000 copies printed.
Mosp. M. I. Jil'kovits, Doctor; Chief Ed. of Publishing House:
Miam Skalník, Doctor; Tech. Ed.: Oldřich Důnka.

PURPOSE: The book is intended for chemists, chemical engineers,
and physiologists.

COVERAGE: The book is a collection of reviews and original papers,
read at the International Polarographic Congress, held in Prague
in 1951. Uses of polarographic Congress, held in Prague
biochemistry, medicine, and industrial chemistry, organic analysis,
either German, Reviews Read at the Congress, Russian and
presented. In the section, English translations of each review and
only those translations in Russian, German, and English which
have not been published in Volume I are presented. The
following scientists participated in the Congress: Professor
Congress: Professor Wilton Amula, Dean of the Faculty of
of Sciences, Warsaw; Doctor Jaromír Dolanek, Minister of
of Plastics; Professor Jaromír Horovský, Chairman of
the Congress; and Professor Jaroslav Fukáček, Chairman of
Development. Scientific Research and Technical

Oxidation of tetrahydronaphthalene in condensed phase. S. MEDVEDEV and A. PODJAPOLSKAJA (J. Phys. Chem. Russ., 1939, 13, 719-737; cf. A., 1939, 1, 149).—Oxidation by O_2 at 65-105° yields chiefly tetralin H peroxide (I) and tetralone (II); no acids or aldehydes are formed. (I) accelerates the reaction, whilst (II), which is formed by the decomp. of (I), retards, by an amount which rises and then becomes const. as the concn. of (II) increases. The oxidation can be resolved into two independent stationary chain reactions. One arises from the thermal activation of tetralin, is retarded by (II), and proceeds by a mechanism similar to that of the oxidation of MeCHO (A., 1931, 572), and the second depends on the decomp. of a compound formed on the wall by collision of a (I) mol. with an adsorbed (II) mol., and is accelerated by (II). Both reactions lead to the accumulation in the system of (I), which gives the oxidation an autocatalytic character. R. C.

TITLE: Digital printing measuring instrument. ¹⁴ Class 42, No. 167317

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 1, 1965, 41-42

TOPIC TAGS: measuring apparatus

ABSTRACT: This Author Certificate presents a digital printing measuring instrument designed to record automatically different variables on a paper tape. The device contains a pointer-type measuring instrument, a pointing mechanism with printing bars, and a motor controlling the position of the bars. To increase the operating reliability the motor is connected to the printing bars by three interconnected sliding slotted frames. The slot of the first frame has ten rectangular steps and is clamped to the printing bar which records the units. The second frame has a slot with ten notches (each notch having ten rectangular steps) and is clamped to the printing bar which records the tens of units. The third frame has a slot with 99 rectangular steps. The end of the pointer of the measuring instrument is fastened to the rod in the gap between these steps. Orig. art. has: 1 figure.
